LOAD & INTEGRITY TESTING

We Carry Out Various Pile Load & Integrity Test Methods On Piles Installed.

High Strain Dynamic Pile Testing (PDA Test)

High Strain Dynamic Pile Testing Is Performed Using A Pile Driving Analyzer (PDA) And Case Pile Wave Analysis Program (CAPWAP) To Assess The Static Load Capacity, Settlement And Integrity Of The Pile Installed.

Low Strain Dynamic Pile Testing (PIT Test)

Low Strain Dynamic Pile Testing Is Performed Using A Pile Integrity Tester (PIT) To Assess The Structural Integrity Of The Pile Installed To Check For Defects Such As Voids, Cracks And Necking.

Sonic Logging Test

Sonic Logging Test Is Carried Out To Detect Concrete Quality, Necking Or Discontinuity Of Pile Cross Sectional Area.

Static Load Test (Maintained Load Test, MLT)

Static Load Test Or Maintained Load Test Is Normally Carried Out To Twice The Designed Working Load Of A Pile By Applying Static Load To The Pile To Ascertain The Bearing Capacity Of The Pile Installed And The Settlement And Rebound Characteristic.

Bi - Directional Load Test

This Is An Alternative Method Of Load Test For Bored Pile And Is Safer Compared With Conventional Method Of Static Load Test Which Require Massive Setting Up Of Concrete Blocks. Based On Soil Investigation And Design Criteria, Suitable Number Of Jacks Will Be Installed At Predetermined Location During The Construction Of Bored Piles. The Piles Will Be Jacked Upwards And Downwards (Bi-Directional) To Ascertain The Friction And Bearing Capacity Of Pile.

PHOTOGRAPHIC VIEWS OF BORED PILE WORKS SEQUENCE

1 Firstly, Qualified Land Surveyor Set Out The Intended Bored Pile Point.

2 OffSets From The Pile Position Are Marked As Guide For Later Reference To Pile Point.

3 The Drilling Rig Is Moved To Near The Pile Position. The Kelly Bar Is Mounted With An Auger And Placed Directly Above The Pile Point. By Means Of Spirit Level The Kelly Bar Is Checked And Adjusted For Verticality.

4 The Auger Is Placed Directly On The Pile Point. With Slow Speed And Repeated Shallow Penetration Into The Soil A Hole Is Formed. The Shallow Augered Hole Is Checked For Accuracy Of Pile Position.

5 Temporary Mild Steel Casing Is Then Installed To Provide Stability Of The Bored Hole. The Verticality And Position Of Casing Is Constantly Checked To Comply Designed Position Of Pile.

6 When Steel Casing Reached Intended Depth, Boring Of The Hole Continues Until The Designed Depth Of The Pile.

7 Soil Stabilization Fluid Plant Set Up At Project Site. Besides Water, Special Fluids (Bentonite Or Polymer) Are Specifically Mixed And Pumped Into Bored Holes During Boring Works To Stabilize The Soil.

8 When Rock Is Encountered, Using Rock Coring Tools To Bore Through To The Required Rock Socket Depth.

9 The Bored Hole Is Cleaned With Cleaning Bucket. The Final Bored Depth Is Checked And Measured Together With The Supervising Engineer's Representative.

10 Prefabricated Reinforcement Steel Cage Is Then Installed Into The Bored Hole.

11 Tremie Pipe Is Installed For Full Depth Of Hole. Concrete Is Placed Through Tremie Pipe Until Beyond The Designed Cut Off Level To Ensure Entire Pile Is Casted With Good Quality Concrete.

12 After Completing Casting, Tremie Pipe And Temporary Casing Are Withdrawn. The Casted Bored Pile Location Is Suitably Protected For Safety.
